

GAP ANALYSIS MATRIX : NEOCRED

PROJECT NAME NEOCRED LOAN PROJECT

PROJECT ID XXXXXXXXX789

RESPONSIBLE PERSON XYZ,ABC,PQR

DATE 05-10-2026

PROJECT OBJECTIVE Diagnose structural inefficiencies in NeoCred's legacy loan onboarding pipeline, quantify current operational drop-offs, and define target requirements to reduce end-to-end processing time , while decreasing user abandonment rate.

FOCUS AREA	CURRENT STATE	DESIRED STATE	THE GAP & BUSINESS IMPACT	STRATEGIC RECOMMENDATION
<i>Application Interface and form design</i>	12 manual form screens requiring repetitive data entry; take ~25 minutes.	4 screen streamlines dynamic auto populated profile data; takes < 3 minutes.	GAP: 8 redundant form screen and high user friction. IMPACT: 90% abandonment rate before form submission.	Redesign UX to an auto filled pre fetched data the primary device.
<i>Document verification and KYC</i>	Manual uploads of documents, reviewed by human operations agent.	Instant automated OCR parsing ,and digital documents verification.	GAP: 3 to 5 days processing delay due to human bottleneck. IMPACT: Loss of potential customers to competitors.	Implement third party OCR API and open banking account aggregator integration for instant document and statement parsing.
<i>Credit scoring and Risk evaluation</i>	Internal operations team manually requests credit score checks from external bureaus via legacy queues.	Automated API integration with external credit bureaus returning scores instantly.	GAP: Manual queuing and hand-off latency between departments. IMPACT: Slow decision turnaround time and bloated operational overhead.	Build a direct webhook/API integration with external credit rating bureaus linked to an automated decision engine.
<i>Status Communication & Transparency</i>	Zero real-time updates; users must repeatedly check the app or wait for delayed emails.	Real-time automated push notifications and SMS updates at every key milestone of the pipeline.	GAP: Complete lack of transparency causing high customer anxiety. IMPACT: High volume of unnecessary support calls and poor customer experience.	Deploy a cloud-based messaging microservice (e.g., Twilio or Firebase) to trigger automated status push alerts.
